

Summation Notation and Function Notation

One of the powerful characteristics of summation notation is that it does not have to be limited to being a short-hand notation for an explicit sum of numbers, such as:

$$\sum_{j=1}^{10} j = 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 + 10$$

Summation notation can also be applied to give a short-hand notation for the sum of a list of function values. For example, let's assume we have some function $f(x)$. We can then use summation notation as follows:

$$\sum_{i=0}^4 f(i) = f(0) + f(1) + f(2) + f(3) + f(4)$$

Example

If $f(x) = x^2 - 4$, evaluate:

$$\sum_{j=2}^5 f(j)$$

Solution

$$\sum_{j=2}^5 f(j) = f(2) + f(3) + f(4) + f(5) = (2^2 - 4) + (3^2 - 4) + (4^2 - 4) + (5^2 - 4) = 0 + 5 + 12 + 21 = 38$$
